Still, in some situations, it might be prudent to verify that data received from a server matches expectations, perhaps with a regular expression, before passing it to the eval statement.. Instead, it is a text-based data interchange format It is the data syntax of JavaScript objects and arrays.

XML is highly extensible because you can invent new tags as needed Listing 1 shows an example of a data structure represented in XML.. A piece of JavaScript code can readily consume JSON-encoded data without going through any special parsing or additional data transformation. [Install Powerpoint 2010 For Free](#)

A code snippet for processing JSON-formatted data received from the server. In the browser-side code snippet in Listing 3, result is the JSON-formatted string received from the server.. The eval statement in Listing 3 will execute whatever code the server returns, so there is a security risk here.. XML-based markup is used to describe data that is represented through tags that need not be predefined. [Riconoscimento Di Debito Fac Simile](#)
